## GEMINI™ SELECT 09DPS018-030, 09DPM035-130 Air-Cooled Condensers with PURON® Refrigerant (R-410A) 50/60 Hz

18 to 130 Nominal Tons (63 to 457 Nominal kW)

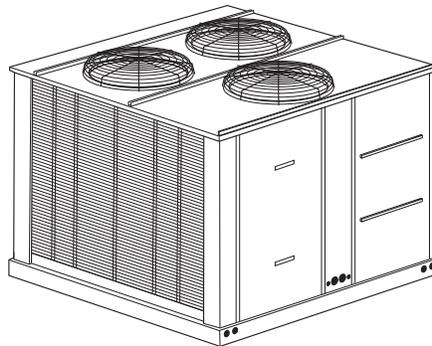

## Gemini™ Select

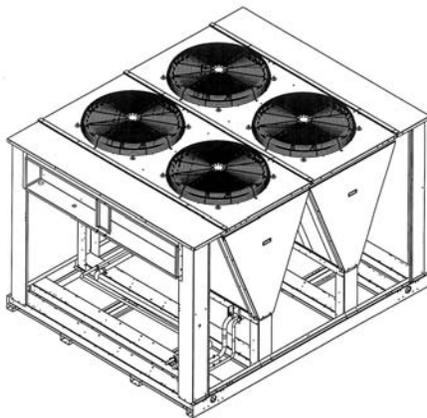

**09DPS030 UNIT WITH  
LOW SOUND OPTION**

**09DPM040 UNIT**

**09DPM065  
UNIT**

These dependable split systems match Carrier's 30MPA (R-410A) and 30HXA (R-134a) air-cooled condenserless chillers with the versatile outdoor 09DP remote air-cooled condensers for a wide selection of commercial cooling solutions.

- Matching 30MPA or 30HXA chillers and 09DP condensers are compatible with ASHRAE 90.1
- Chlorine-free, non-ozone depleting Puron (R-410A) and R-134a refrigerants
- Condenser coils feature the Novation® heat exchanger with microchannel coil technology
- 09DPS single-circuit units are offered in 18 to 30 ton sizes
- 09DPM single or dual-circuit units are offered in 35 to 130 ton sizes

## Features/Benefits

The 09DP condensers offer the utmost in system configuration ideal for clinics, motels, schools, apartments, office buildings, and factories. These premium quality standard components ensure durable, efficient, and reliable operation.

The latest safety standards for 09DP units are certified to UL (Underwriters Laboratories) and CSA (Canadian Standards Association) standards, ETL approved.

# Features/Benefits (cont)

## Versatility

The 09DP Series air-cooled remote condensers feature up to 2 refrigerant circuits, and can be matched with a wide variety of air-cooled condenser-less chillers. Single-circuit condensers can operate with single or dual chillers. Dual-circuit condensers can operate with single or dual chillers.

## Durable construction

All 09DP units have weatherized cabinets constructed of heavy-duty galvanized steel prepainted with corrosion resistant baked enamel. Inside and outside surfaces are protected to ensure long life and good appearance. The durable, galvanized steel, prepainted components exceed the requirements of the 500-hour salt spray test per ASTM (American Society for Testing and Materials) B117.

All 09DP condensers have Novation® heat exchangers with microchannel coil technology. The microchannel heat exchanger (MCHX) coils provide long-term reliability, high performance heat transfer, and significant savings in refrigerant charge. E-coated MCHX is offered as an option for harsh industrial or coastal conditions.

## Refrigerant circuiting

The 09DPM units have single or dual independent circuit capability with factory included kit on all 09DPM units (field installation required). Each circuit is protected by a temperature fusible plug for safety.

## Easier installation and service

The 09DP units are available with factory-installed options (e-coated MCHX coil, low sound fans, high short circuit current rating (SCCR) interrupt, Motor-master® V control, non-fused disconnect, and security grilles/hail guards) for every installation.

## Greater system economy

Subcooling offers more cooling capacity. A specially designed liquid refrigerant circuit provides subcooling

for increased capacity without additional power consumption. Subcooling liquid refrigerant also expands condenser applications by permitting condenser installation below the evaporator without subjecting the refrigerant to flashing before the expansion valve.

## Quieter, more efficient operation

AeroAcoustic™ low sound fans provide efficient airflow and quiet operation.

## Multi-circuit, multi-refrigerant capability

Choose the single-circuit 09DPS or single/dual-circuit 09DPM unit and realize separate cooling system economy on each circuit. Single-circuit units are offered in sizes 018 to 130. Dual-circuit units are offered in sizes 035 to 130. Using the 09DPM unit, save space and satisfy installation needs without the expense of smaller condensers with single circuitry. Models can be used with refrigerants R-410A or R-134a to meet individual system capacity requirements. A different refrigerant can be used with each independent cooling circuit. Units are shipped with R-410A pressure switches for field installation. Use of R-134a or R-22 refrigerants would require field-supplied and installed pressure switches.

## Individual unit features

**The 09DPS018-030 condenser units** are available in 18, 20, and 30-ton sizes using a single coil design (with integral subcooling) that is used as single system. Units have vertical air discharge and contain a control box, 2 direct-drive fans and motors (one for size 018), and motor mounts.

**The 09DPM035-060 condenser units** are available in 35, 40, 50 and 60-ton sizes. The 09DPM035 units have 2 direct-drive fans, 2 motors and motor mounts. The 09DPM040 units have 3 direct-drive fans, 3 motors and motor mounts. The 09DPM050,060 units have 4 direct-drive fans, 4 motors

and motor mounts. For all units, fan motors are 3-phase, TEAO (totally enclosed, air over). All units are equipped with a control box and 2 condenser coils with integral subcooling circuits. Each condenser is offered as a single circuit or dual circuit unit.

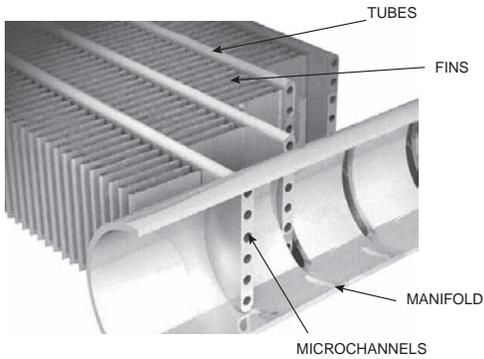

**The 09DPM065-095 condenser units** are available in 65, 75, 85, and 95-ton sizes. The 09DPM065 unit has 4 direct-drive fans, 4 motors and motor mounts, and 2 V coils. The 09DPM075 unit has 5 direct-drive fans, 5 motors and motor mounts. The 09DPM085,095 units have 6 direct-drive fans, 6 motors and motor mounts. All fan motors are 3-phase and are protected against single phasing conditions. The 09DPM075-095 units have 3 V coils.

**The 09DPM115-130 condenser units** are available in 115 and 130-ton sizes. The 09DPM115 unit has 7 direct-drive fans, 7 motors and motor mounts. The 09DPM130 unit has 8 direct-drive fans, 8 motors and motor mounts. The 09DPM115,130 units have 4 V coils.

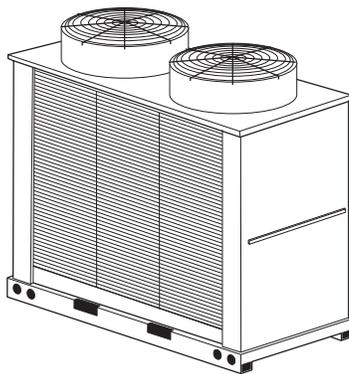

All 09DP units are equipped with control box access panels, which allow for easy entrance into the control box. A tubing package is supplied with the dual-circuit condenser units (09DPM) for single or dual coil circuiting applications to facilitate field installations and maximize unit flexibility.

## Coil split versatility

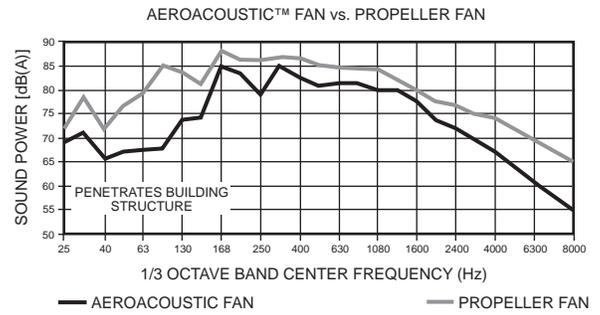

Model 09DPM coils can be split into one or 2 condensing circuits. Each 09DPM unit ships standard as a dual-circuit unit but can be field-modified to a single-circuit unit by installing the manifold kit that ships with the unit. Each circuit may handle a separate cooling system, using a different refrigerant if desired. Each circuit has a refrigerant subcooling circuit. This saves space and provides installation flexibility.

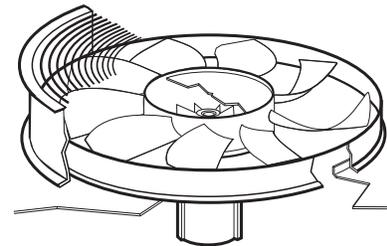

**NOVATION® HEAT EXCHANGER TECHNOLOGY  
WITH MICROCHANNEL CONDENSER COILS**

**LOW SOUND OPTION**

**AEROACOUSTIC FAN VS PROPELLER FAN**

**LOW-NOISE AEROACOUSTIC FAN**

# Options and accessories

ITEM	FACTORY-INSTALLED OPTION	FIELD-INSTALLED ACCESSORY
Condenser Coil/Low Sound Options		
E-Coated MCHX	X	
Low Sound Fan(s)	X	X
Vibration isolation Pads		X
Ambient/Capacity Control/Interrupt Options		
High Short Circuit Current Rating Interrupt	X	
Motormaster V Low Ambient Control	X	X
Electrical Options		
Non-Fused Disconnect	X	
Packaging/Security Options		
Bottom Skid	X	
Bottom Skid, Top Crate, Bag	X	
Security Grilles/Hail Guards	X	X
Wind Baffles		X

## LEGEND

**E-Coated** — Epoxy Coating Applied to Entire Coil Assembly  
**MCHX** — Microchannel Heat Exchanger

## NOTES:

1. Std Interrupt - SCCR (short circuit current rating) (5K)
2. High Interrupt - SCCR 460-v and 380/415-v (65K), 208/230-v (65K), 575-v (25K)

## Factory-installed options

**E-coated Novation® heat exchanger technology microchannel coil (aluminum fin/aluminum tube) condenser** is available for optimum durability. Novation heat exchangers with microchannel coil technology are offered coated or uncoated to match coil protection to site conditions. The Carrier Electronic Catalog (E-Cat) can be used to determine whether or not corrosion protection is recommended for particular applications in coastal/marine environments. Following the input of the requested data, the E-Cat program output will advise the appropriate coil to be used. Other factors described in "Selection Guide: Environmental Corrosion Protection, Novation Heat Exchanger with Microchannel Coil Technology" catalog number 04-581042-01 must also be considered to determine if corrosion protection is required.

**Low sound AeroAcoustic™ fans** provide a specially designed system of fan propellers and stacks that reduce sound by 7 to 10 dbA depending on unit size, without reducing unit performance. The factory-installed fan option is compatible with the Motormaster® V option. Low sound fans are also available as field-installed accessory.

**High short circuit current rating interrupt** provides a short circuit current rating protection for the unit up to 65,000 A on 460-v, 380/415-v, and 208/230-v units or 25,000 A on 575-v units.

**Motormaster® V low-ambient control** provides control of outdoor-fan motor operation to maintain head pressure at outdoor ambient temperatures down to -20 F (-29 C) for 50 and 60 Hz units. One factory-installed low ambient temperature kit per unit is required on sizes 018 to 060. Two factory-installed low ambient temperature kits per unit are required on sizes 065 to 130. This option also requires field-installed wind baffles. The Motormaster V low-ambient control is also available as a field-installed accessory.

**Non-fused disconnect** includes factory-installed non-fused disconnect capability for power and control located at the unit.

**Packaging options** include bottom skid with standard coil protection and bottom skid, top crate with bag. Standard coil protection is also included on all unit packaging.

**Security grilles/hail guards** consist of louvered, sheet metal panels which securely fasten to the unit and provide condenser coil protection against hail and physical damage. Security grilles/hail guards are also available as field-installed accessories.

## Field-installed accessories

**Low sound fans** provide a specially designed system of fan propellers and stacks that reduce sound without reducing unit performance. The field-installed fan accessory is compatible with the Motormaster V option. Low sound fans are also available as factory-installed option.

**Vibration isolation pads** reduce vibration transmission from the unit through the floor and into the conditioned space. The neoprene isolator pads measure 1/4 in. thick (24 in. x 3 in.).

**Motormaster® V low-ambient control** provides control of outdoor-fan motor operation to maintain head pressure at outdoor ambient temperatures down to -20 F (-29 C) for 50 and 60 Hz units. One field-installed low ambient temperature kit per unit is required on sizes 018 to 060. Two field-installed low ambient temperature kits per unit are required on sizes 065 to 130. This accessory also requires field-installed wind baffles. The Motormaster V low-ambient control is also available as a factory-installed option.

**Security grilles/hail guards** consist of louvered, sheet metal panels which securely fasten to the unit and provide condenser coil protection against hail and physical damage. Security grilles/hail guards are also available as a factory-installed option.

**Wind baffles** facilitate operation down to -20 F (-29 C) when used in conjunction with low ambient temperature head pressure control.

7. CARRIER DOES NOT RECOMMEND INSTALLATION IN A PIT.

8. UNIT CAN BE HANDLED USING CRANE. REFER TO SERVICE INSTALLATION INSTRUCTION.

9. WEIGHT DOES NOT INCLUDE UNIT REFRIGERANT CHARGE.

DIMENSIONS IN [ ] ARE IN MILLIMETERS

# Selection procedure

**I Select minimum or maximum charge ratings.**

List the refrigerant, total heat rejection (THR), suction and discharge temperatures as determined from compressor data.

**II Determine condensing temperature (saturated discharge temperature minus discharge line loss).**

**III Determine temperature difference (condensing temperature minus entering-air temperature).**

**IV Enter Condenser Ratings table (minimum or maximum charge as determined in Step 1) at selected refrigerant and established temperature difference (TD).**

Read across to total heat rejection equal to or greater than required. Interpolate if necessary. Read unit size.

EXAMPLE: (Maximum Charge)

Given:

R-410A, Maximum Charge  
 THR (including subcooling) . . . . . 59 Tons  
 Saturated Discharge Temperature . . . . . 124.2 F

Saturated Suction Temperature . . . . . 40 F  
 Entering-Air Temperature . . . . . 95 F  
 Discharge Line Loss . . . . . 2 F

Cond Temp = 124.2 F - 2 F = 122.2 F

TD = 122.2 F - 95 F = 27.2 F

Interpolate in Condenser Ratings table (maximum charge) and obtain capacity of 09DPM050 as 60.7 tons. Select the 09DPM050.

EXAMPLE: (Minimum Charge)

Given:

R-410A, Minimum Charge  
 THR . . . . . 35 Tons  
 Saturated Discharge Temperature . . . . . 122 F  
 Saturated Suction Temperature . . . . . 40 F  
 Entering-Air Temperature . . . . . 95 F  
 Discharge Line Loss . . . . . 2 F

Cond Temp = 122 F - 2 F = 120 F

TD = 120 F - 95 F = 25 F

Enter Condenser Ratings table (minimum charge) and select 09DPM035 at 25 F TD with 38 tons THR.

\*TD (Temperature Difference) = Saturated Condensing Temperature (entering) – Entering-Air Temperature.

### NOTES:

- Minimum charge gives higher heat rejection, since entire surface of condenser and subcooling circuit is used for condensing only. Minimum charge ratings, however, do not represent greatest potential system capacity. They are comparable to competitive ratings without subcooling.
- Use maximum charge when compressor, condenser, and evaporator are selected as a package and the components balanced to secure maximum benefits of 15 F subcooling (for example, in

- selecting 09DP condensers with Carrier compressor rated at 15 F subcooling). Maximum charge activates the subcooling circuit, resulting in higher system capacity at slightly higher head pressure and corresponding condensing temperature. Liquid refrigerant leaves the system subcooled to a stable condition to allow greater length of refrigerant run or lift. See Application Data section, page 29, for available liquid lift information.
- Condenser subcooling = Saturated condensing temperature of refrigerant – Actual temperature of refrigerant leaving the coil.

\*TD (Temperature Difference) = Saturated Condensing Temperature (entering) – Entering-Air Temperature.

### NOTES:

1. Minimum charge gives higher heat rejection, since entire surface of condenser and subcooling circuit is used for condensing only. Minimum charge ratings, however, do not represent greatest potential system capacity. They are comparable to competitive ratings without subcooling.
2. Use maximum charge when compressor, condenser, and evaporator are selected as a package and the components balanced to secure maximum benefits of 8.3° C subcooling (for example, in

- selecting 09DP condensers with Carrier compressor rated at 8.3° C subcooling). Maximum charge activates the subcooling circuit, resulting in higher system capacity at slightly higher head pressure and corresponding condensing temperature. Liquid refrigerant leaves the system subcooled to a stable condition to allow greater length of refrigerant run or lift. See Application Data section, page 30, for available liquid lift information.
3. Condenser subcooling = Saturated condensing temperature of refrigerant – Actual temperature of refrigerant leaving the coil.

### LEGEND

- AWG** — American Wire Gage
- FIOP** — Factory-Installed Option
- FLA** — Full Load Amps
- MCA** — Minimum Circuit Amps, complies with NEC, Article 430-24
- MOCP** — Maximum Overcurrent Protection (Amps)
- NEC** — National Electrical Code

1. Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is voltage 2% and amps 10%.
2. All units or modules have single point primary power connection. Main power must be supplied from a field-supplied disconnect.

3. All terminal block units should be capable of handling 14 AWG to 2 AWG.
4. Disconnect units with MOCP of greater than 40 require 8 AWG to 1 AWG.
5. Disconnect units with MOCP less than 40 require 14 AWG to 6 AWG.
6. For all high short circuit capable FIOP units, fuses must be used for overload protection.

**LEGEND**

- AWG** — American Wire Gage
- FIOF** — Factory-Installed Option
- FLA** — Full Load Amps
- MCA** — Minimum Circuit Amps, complies with NEC, Article 430-24
- MOCP** — Maximum Overcurrent Protection (Amps)
- NEC** — National Electrical Code

1. Units are suitable for use on electrical systems where voltage supplied to the unit terminals is not below or above the listed minimum and maximum limits. Maximum allowable phase imbalance is voltage 2% and amps 10%.
2. All units or modules have single point primary power connection. Main power must be supplied from a field-supplied disconnect.

3. All terminal block units should be capable of handling 14 AWG to 2 AWG.
4. Disconnect units with MOCP of greater than 40 require 8 AWG to 1 AWG.
5. Disconnect units with MOCP less than 40 require 14 AWG to 6 AWG.
6. For all high short circuit capable FIOF units, fuses must be used for overload protection.

# Typical wiring schematic

- NOTES:
- FACTORY WIRING IS IN ACCORDANCE WITH UL 1995 STANDARDS. FIELD MODIFICATIONS TO THIS WIRING SHALL BE THE RESPONSIBILITY OF THE INSTALLER.
  - ALL UNITS OR MODULES HAVE SINGLE POINT PRIMARY POWER CONNECTION. MAIN POWER MUST BE SUPPLIED FROM A FIELD OR FACTORY SUPPLIED DISCONNECT.
  - WIRING FOR MAIN FIELD SUPPLY MUST BE RATED 75C. USE COPPER CONDUCTORS ONLY.
    - INCOMING WIRE SIZE RANGE FOR TERMINAL BLOCK IS 14 AWG (AMERICAN WIRE GAGE)
    - INCOMING WIRE SIZE FOR NON-FUSED DISCONNECT WITH MCA UP TO 38 AMPS IS 14 TO 6 AWG. FOR MCA GREATER THAN 38 AMPS IS 8 TO 1 AWG.
  - REFER TO CERTIFIED DIMENSIONAL DRAWINGS FOR EXACT LOCATIONS OF THE MAIN POWER AND CONTROL POWER ENTRANCE LOCATIONS.
  - TERMINALS 2 AND 3 TOGETHER AND TERMINALS 1 AND 4 TOGETHER FOR SINGLE UNIT OPERATION.
  - ALL UNITS RATED FOR HIGH SHORT CIRCUIT INTERRUPT CAPABILITY MUST BE PROTECTED USING FUSES.

# Typical piping and wiring

## TYPICAL 30MPA REFRIGERANT PIPING TO 09DP REMOTE CONDENSER (30MPA030 and 09DPS030 Units Shown)

### NOTES:

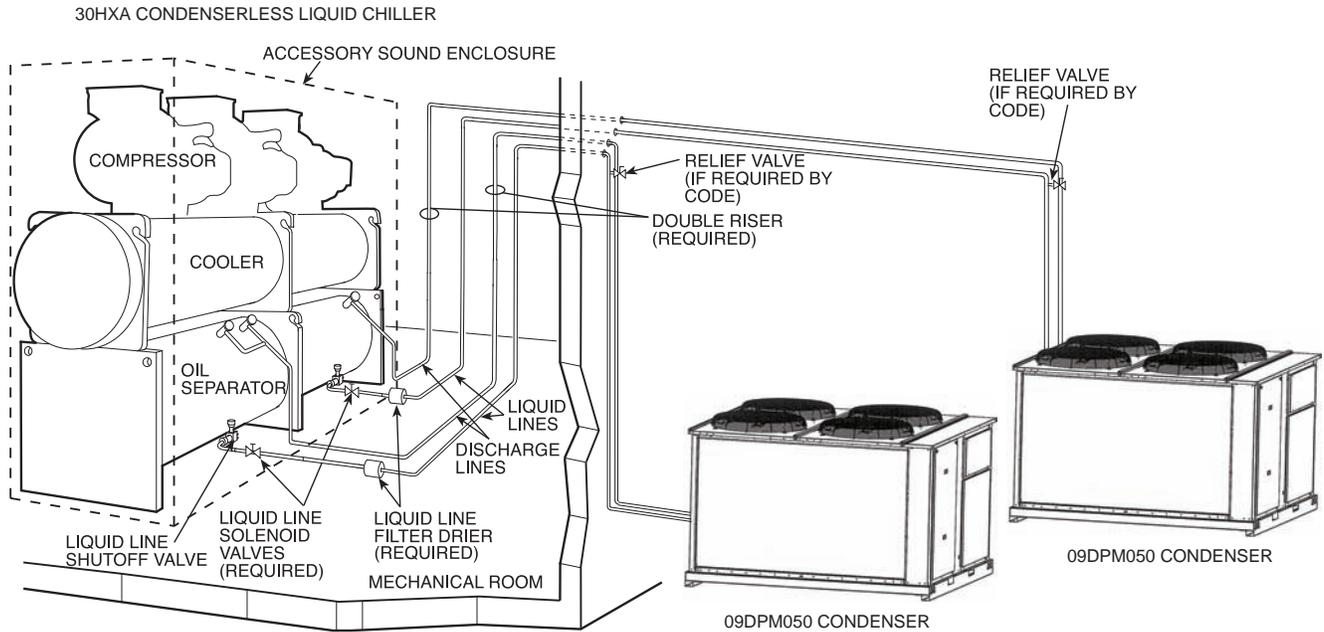

1. Chiller and condenser must be installed *levelly* to maintain proper compressor oil return.
2. Wiring and piping shown are general points-of-connection guides only and are not intended for a specific installation. Wiring and piping shown are for a quick overview of system and are not in accordance with recognized standards.
3. All wiring must comply with applicable local and national codes.
4. All piping must follow standard piping techniques. Refer to Carrier System Design Manual part 3, Carrier E20-II software Refrigerant Piping program, or appropriate ASHRAE (American Society of Heating, Refrigerating, and Air Conditioning Engineers) handbook for details on proper piping sizes and design.
5. See Physical Data section for approximate refrigerant charge.
6. Hot gas lines should rise above refrigerant level in condenser circuit. Double riser may be required; check unit minimum capacity.
7. Trap should be installed on hot gas lines to prevent condenser oil and refrigerant vapor migration from accumulating in the compressor during off cycle.
8. Pitch all horizontal lines downward in the direction of refrigerant flow.
9. For piping lengths greater than 50 ft, provide support to liquid and gas lines near the connections to the condenser coil.
10. For pressure relief requirements, see latest revision of ASHRAE Standard 15, Safety Code for Mechanical Refrigeration.
11. All 09DP units have factory-installed contactors.

# Typical piping and wiring (cont)

## TYPICAL 30HXA CONDENSERLESS LIQUID CHILLER REFRIGERANT PIPING TO 09DP REMOTE CONDENSERS (30HXA076 and 09DPM050 Units Shown)

### NOTES:

1. Chiller and condenser must be installed *levelly* to maintain proper compressor oil return.
2. Wiring and piping shown are general points-of-connection guides only and are not intended for a specific installation. Wiring and piping shown are for a quick overview of system and are not in accordance with recognized standards.
3. All wiring must comply with applicable local and national codes.
4. All piping must follow standard piping techniques. Refer to Carrier System Design Manual part 3, Carrier E20-II software Refrigerant Piping program, or appropriate ASHRAE (American Society of Heating, Refrigerating, and Air Conditioning Engineers) handbook for details on proper piping sizes and design.
5. See Physical Data section for approximate refrigerant charge.
6. Hot gas lines should rise above refrigerant level in condenser circuit. Double riser may be required; check unit minimum capacity.
7. Trap should be installed on hot gas lines to prevent condenser oil and refrigerant vapor migration from accumulating in the compressor during off cycle.
8. Pitch all horizontal lines downward in the direction of refrigerant flow.
9. For piping lengths greater than 50 ft (15.2 m), provide support to liquid and gas lines near the connections to the condenser coil.
10. For pressure relief requirements, see latest revision of ASHRAE Standard 15, Safety Code for Mechanical Refrigeration.
11. All 09DP units have factory-installed contactors.

# Application data

## Liquid lift

The amount of liquid lift available before refrigerant flashing occurs depends on the amount of liquid subcooling in the system.

All 09DP condensers have positive subcooling when applied with an optimum charge. With subcooling, it is possible to overcome an appreciable friction drop and/or static head (due to the elevation of the liquid metering device above the condenser).

When 09DP condensers are applied with a minimum charge, minimal subcooling in the condenser is realized; therefore, if subcooling is required it must be obtained by external means such as a liquid suction interchanger.

The average amount of liquid lift available from the 09DP condensers is shown in the accompanying table.

## Head pressure control

A drop in entering outdoor-air temperature results in a lower saturated condensing temperature. When the outdoor-air temperature drops below the minimum temperatures listed in the Minimum Outdoor-Air Operating Temperature tables on page 31 and 32, head pressure control is required.

**Fan cycling control** — Fan cycling control is used primarily during intermediate seasons. One fan is cycled for 09DPS018-030 and 09DPM035 units. Two fans are cycled on 09DPM040 and 065 units. Three fans are cycled on 09DPM050,060 and 075 units. Four fans are cycled on 09DPM085 and 095 units. Five fans are cycled on 09DPM115 units. Six fans are cycled on 09DPM130 units.

Units are shipped standard with head pressure switches for use with R-410A refrigerant for field installation. Use of R-134a or R-22 refrigerants would require field-supplied and installed pressure switches. Carrier 30HXA units are shipped with head pressure switches for use with R-134a refrigerant.

**Motormaster® V head pressure control** — Head pressure on all 09DPS and 09DPM units may be controlled with the Motormaster V head pressure control. This head pressure control of outdoor-fan motor operation to maintain the proper liquid pressure at low outdoor ambient temperatures down to -20 F (-29 C) for 50 and 60 Hz units. One field or factory-installed low ambient temperature kit per unit is required on sizes 018-060. Two field or factory-installed low ambient temperature kits per unit are required on sizes 065-130. Motormaster controller is compatible with the standard factory-installed 3-phase motors. This control is available as a factory-installed option or field-installed accessory and requires field-installed wind baffles.

## Process applications

Process applications are defined as heat rejection loads that are not related to or significantly affected by outside ambient conditions. Process applications tend to have constant heat rejection requirements throughout the year. Consequently, these applications may require switching the set points on standard accessory fan cycle controls. Consult Application Engineering for assistance in designing and selecting process systems.

### Novation® heat exchanger technology micro-channel coil (aluminum fin/aluminum tube) condenser

Coil is available for optimum durability. Novation heat exchangers with microchannel coil technology are offered coated or uncoated to match coil protection to site conditions. The Carrier Electronic Catalog (E-Cat) can be used to determine whether or not corrosion protection is recommended for particular applications in coastal/marine

environments. Following the input of the requested data, the E-Cat program output will advise the appropriate coil to be used. Other factors described in "Selection Guide: Environmental Corrosion Protection, Novation Heat Exchanger with Microchannel Coil Technology" catalog number 04-581042-01 must also be considered to determine if corrosion protection is required.

# Guide specifications

## Commercial Air-Cooled Condensers with Puron® Refrigerant (R-410A) or R-134a Refrigerant, 50/60 Hz

### HVAC Guide Specifications

Size Range: **18 to 130 Nominal Tons**  
**(63 to 457 Nominal kW)**

Carrier Model Number: **09DPM, 09DPS**

#### Part 1 — General

##### 1.01 SYSTEM DESCRIPTION

Outdoor-mounted, air-cooled condenser suitable for refrigerant R-410A or R-134a on the ground or rooftop installation. The 09DPS unit shall have one refrigeration circuit and the 09DPM unit shall have two independent refrigeration circuits capable of field conversion to single circuit. Unit shall have air-cooled coils, propeller-type condenser fans, a control box, and shall discharge condenser air vertically upward as shown on certified drawings. Unit shall be used in refrigeration circuit with 30MPA or 30HXA air-cooled condenserless chillers.

##### 1.02 QUALITY ASSURANCE

- A. Unit construction shall comply with latest edition of ASHRAE 15 Safety Code, UL 1995, and ASME applicable codes (U.S.A. codes).
- B. Unit shall be manufactured in a facility registered to ISO 9001:2000 Manufacturing Quality Standard.
- C. Base unit shall be constructed in accordance with UL standards and CSA.
- D. Unit cabinet shall be capable of withstanding 500-hour salt-spray exposure per ASTM B117 (scribed specimen).
- E. Design pressure shall be 650 psig (4482 kPa).
- F. Unit shall be functional checked at the factory.
- G. Unit shall be rated using refrigerants R-410A and R-134a. Ratings shall be listed at minimum (5° F subcooling) and maximum (15° F subcooling) refrigerant charge.

##### 1.03 DELIVERY, STORAGE, AND HANDLING

Unit shall be shipped as single package and shall be stored and handled per unit manufacturer's recommendations.

##### 1.04 WARRANTY (FOR INCLUSION BY SPECIFYING ENGINEER)

#### Part 2 — Products

##### 2.01 EQUIPMENT

###### A. General:

Factory assembled, single-piece, air-cooled remote condenser. Contained within the unit enclosure shall be all factory wiring, piping, controls, nitrogen holding charge, and special features required prior to field start-up.

###### B. Unit Cabinet:

1. Cabinet shall be galvanized steel casing with a baked enamel powder or pre-painted finish.

2. Cabinet shall be capable of withstanding 500-hr salt spray test in accordance with ASTM (U.S.A.) B-117 standard.
3. Control box access panels shall be removable for service access.
4. Lifting holes shall be provided to facilitate rigging.

###### C. Fans:

1. Condenser fans shall be direct-drive propeller type, discharging air vertically upward.
2. All condenser fan motors shall be totally enclosed 3-phase type with permanently lubricated ball bearings, class F insulation and internal, automatic-reset thermal overload protection.
3. Shafts shall have inherent corrosion resistance.
4. Fan blades shall be statically and dynamically balanced.
5. Condenser-fan openings shall be equipped with PVC-coated steel wire safety guards.

###### D. Condenser Coils:

1. Coil shall be air-cooled microchannel heat exchanger (MCHX) and shall have a series of flat tubes containing a series of multiple, parallel flow microchannels layered between the refrigerant manifolds. Microchannel coils shall consist of a two-pass arrangement. Coil construction shall consist of aluminum alloys for the fins, tubes and manifolds in combination with a corrosion-resistant coating on the tubes.
2. Tubes shall be cleaned, dehydrated, and sealed.
3. Assembled condenser coils shall be leak tested and pressure tested at 650 psig (4482 kPa).

###### E. Refrigeration Components:

Refrigeration circuit components shall include liquid line temperature relief device and nitrogen holding charge.

###### F. Controls and Safeties:

Unit controls shall include:

1. Unit shall have a temperature fusible plug for safety on each refrigerant circuit.
2. Self-contained low voltage control circuit.
3. Cycle condenser fans to maintain proper head pressure control.

###### G. Operating Characteristics:

1. Unit shall be capable of rejecting the required heat at the required cfm and be capable of operating down to moderate ambient temperatures with standard factory supplied fan cycling.
2. Head pressure fan cycling control utilizes temperature switches for 09DP018-035 and 065 units.
3. Head pressure fan cycling control utilizes temperature and pressure switches for 09DP040-060 and 075-130 units.

# Guide specifications (cont)

4. Operation to  $-20\text{ F}$  ( $-28.9\text{ C}$ ) shall be possible with Motormaster® head pressure control.

## H. Electrical Requirements:

1. A dual power supply of the correct voltage shall be required for each series unit. A 3-phase power circuit voltage and a 24 volt single-phase control circuit shall be required.
2. The number of control circuits shall depend on the unit application, whether it is matched with one unit or two units.
3. Power supplies for all units shall enter the control box through factory-punched entrance holes in the control box shelf.
4. Terminal blocks shall be supplied for field wiring connections.
5. Units shall utilize electromechanical fan cycling head pressure controls to control proper head pressure.

## I. Special Features:

1. Low Ambient Control:
  - a. Control shall regulate fan motor speed in response to the saturated condensing temperature of the unit. The control shall be capable of operating with outdoor temperatures at  $-20\text{ F}$  ( $-28.9\text{ C}$ ).
  - b. Motormaster® low ambient control shall be available as a factory-installed option or field-installed accessory for all units.
2. Optional E-Coated MCHX Condenser Coil:

E-coated aluminum microchannel coils shall have a flexible epoxy polymer coating uniformly applied to all coil external surface areas without material bridging between fins or louvers. Coating process shall ensure complete coil encapsulation, including all exposed fin edges. E-coat thickness of 0.8 to 1.2 mil with top coat having a uniform dry film thickness from 1.0 to 2.0 mil on all external coil surface areas, including fin edges, shall be provided. E-coated coils shall have superior hardness characteristics of 2H per ASTM D3363-00 and cross-hatch adhesion of 4B-5B per ASTM D3359-02. E-coated products shall have superior impact resistance with no cracking, chipping or peeling

per NSF/ANSI 51-2002 Method 10.2 (U.S.A. Standards).

## 3. Sound Reduction:

- a. Low sound fan for sound reduction is available as a factory-installed option or field-installed accessory for all units.
- b. Low sound fans shall be direct driven, 9-blade, airfoil cross-section type with reinforced polymer construction and shrouded axial fan. Fan shall be statically and dynamically balanced with inherent corrosion resistance.

## 4. Non-Fused Disconnect:

A non-fused disconnect is available as a factory-installed option for all units having single point power connection units.

## 5. High Short Circuit Current Rating (SCCR):

The optional high SCCR interrupt capability shall allow the unit to tolerate a 65 kA (208/230v, 380v and 460-v units) or 25 kA (575-v units) short circuit current for a brief period of time while protecting downstream components. The high SCCR option shall provide a higher level of protection than the standard unit (option for 60 Hz only). High interrupt shall be available as factory-installed option on all units.

## 6. Security Grilles/Hail Guards:

Units shall be supplied with factory-installed or field-installed louvered, sheet metal panels which securely fasten to the unit to provide condenser coil protection against hail and physical damage.

## 7. Vibration Isolation Pads:

Neoprene vibration isolation pads (24 in. x 3 in. x  $\frac{1}{4}$  in.) shall be available for field installation to reduce vibration transmission from the compressor through the floor and into the conditioned space.

## 8. Wind Baffle Kit:

Field-installed accessory kit shall provide wind baffles for use with low ambient temperature operation.
